

Tropical Mosquito-borne Diseases Nucleic Acid Test Kit

Fluorescent Probe-Based Real-Time PCR Assay

Tropical mosquito-borne diseases like Dengue, Zika, Chikungunya, and Yellow Fever are prevalent in tropical and subtropical regions, including Southeast Asia, Central and South America, the Caribbean, Africa, and the Pacific Islands. These areas share warm, humid climates that favor the breeding of Aedes mosquitoes, the primary vectors of these diseases. Urbanization, poor water management, and global travel further contribute to their spread. Many regions, such as Brazil, India, and Thailand, face overlapping risks of multiple diseases, underscoring the need for comprehensive diagnostic solutions.

Testing Principle

This kit uses polymerase chain reaction (PCR) technology based on TaqMan fluorescent probe to detect the RNA of Zika virus, Dengue virus and Chikungunya virus in human serum specimens collected from patients or suspected patients.

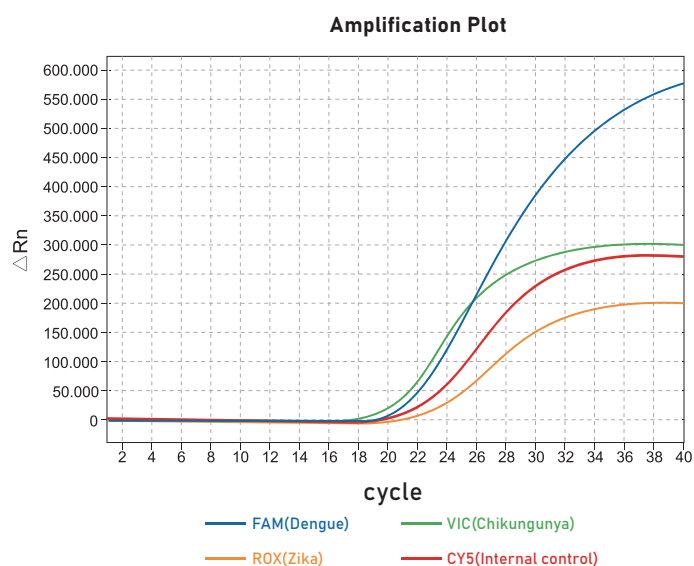

Product Features

- Simultaneously identifies Zika, Dengue, and Chikungunya viruses in a single test.
- Detects viral with an LOD of 1000 copies/mL, reducing false negatives and ensuring accuracy.
- Provides results in less than 90 minutes, enabling timely decision-making and patient management.

Recommended Thermal Cyclers

- Applied Biosystems™7500 Real-Time PCR System
- Stratagene MX 3000P Real-Time PCR System
- BioRad CFX96 Real-Time PCR System
- Other Real-Time Thermal Cyclers which could detect FAM, VIC/HEX, ROX and CY5 simultaneously
